1 Introduction

This technical file contains detailed descriptions for monitoring during operation, fault elimination, and maintenance.

It also includes safety instructions and general information about the product.

Information about installation can be found in the installation and commissioning instructions.

This technical file is intended solely for specially trained and authorized personnel.

1.1 Manufacturer

The product is manufactured by:

Maschinenfabrik Reinhausen GmbH
Falkensteinstraße 8
93059 Regensburg
Tel.: (+49) 9 41/40 90-0
E-mail: sales@reinhausen.com

Further information on the product and copies of this technical file are available from this address if required.

1.2 Completeness

This technical file is incomplete without the supporting documents.

The following documents are considered supporting documents:

- Unpacking instructions
- Supplement
- Routine test report
- Connection diagrams
- Dimensional drawings
- Order confirmation

1.3 Safekeeping

Keep this technical file and all supporting documents ready at hand and accessible for future use at all times.
1.4 Notation conventions

1.4.1 Hazard communication system

Warnings in this technical file are displayed as follows.

1.4.1.1 Warning relating to section

Warnings relating to sections refer to entire chapters or sections, sub-sections or several paragraphs within this technical file. Warnings relating to sections use the following format:

⚠️ WARNING

Source of the danger and outcome.
► Action
► Action

1.4.1.2 Embedded warning information

Embedded warnings refer to a particular part within a section. These warnings apply to smaller units of information than the warnings relating to sections. Embedded warnings use the following format:

⚠️ DANGER!

Instruction for avoiding a dangerous situation.

1.4.1.3 Signal words and pictograms

The following signal words are used:

<table>
<thead>
<tr>
<th>Signal word</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>DANGER</td>
<td>Indicates a hazardous situation which, if not avoided, will result in death or serious injury.</td>
</tr>
<tr>
<td>WARNING</td>
<td>Indicates a hazardous situation which, if not avoided, could result in death or serious injury.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.</td>
</tr>
<tr>
<td>NOTICE</td>
<td>Indicates measures to be taken to prevent damage to property.</td>
</tr>
</tbody>
</table>

1.4.2 Information system

Information is designed to simplify and improve understanding of particular procedures. In this technical file it is laid out as follows:

Important information.

1.4.3 Instruction system

This technical file contains single-step and multi-step instructions.

Single-step instructions

Instructions which consist of only a single process step are structured as follows:
1 Introduction

Aim of action
✓ Requirements (optional).
► Step 1 of 1.
   ⇓ Result of step (optional).
   ⇓ Result of action (optional).

Multi-step instructions
Instructions which consist of several process steps are structured as follows:
Aim of action
✓ Requirements (optional).
1. Step 1.
   ⇓ Result of step (optional).
2. Step 2.
   ⇓ Result of step (optional).
   ⇓ Result of action (optional).
2 Safety

▪ Read this technical file through to familiarize yourself with the product.
▪ This technical file is a part of the product.
▪ Read and observe the safety instructions provided in this chapter.
▪ Read and observe the warnings in this technical file in order to avoid function-related dangers.
▪ The product is manufactured on the basis of state-of-the-art technology. Nevertheless, risks to life and limb for the user or impairment of the product and other material assets due to the function may arise in the event of improper use.

2.1 Appropriate use

The product is an on-load tap-changer and adjusts the transmission ratio of transformers without interrupting the load flow. The product is designed solely for use in electrical energy systems and facilities. If used as intended and in compliance with the requirements and conditions specified in this technical file as well as the warning notices in this technical file and attached to the product, then the product does not present any danger to people, property or the environment. This applies throughout the service life of the product, from delivery, installation and operation to removal and disposal.

The following is considered intended use:
▪ Use the product only with the transformer/motor-drive unit specified in the order.
▪ The serial numbers of on-load tap-changer and on-load tap-changer accessories (drive, drive shaft, bevel gear, protective relay, etc.) must match if the on-load tap-changer and on-load tap-changer accessories are supplied as a set for one order.
▪ You will find the standard valid for the product and the year of issue on the nameplate.
▪ Operate the product in accordance with this provided technical file, the agreed delivery conditions and technical data.
▪ Ensure that all necessary work is performed by qualified personnel only.
▪ Only use the equipment and special tools included in the scope of delivery for the intended purpose and in accordance with the specifications of this technical document.

Permitted electrical operating conditions

In addition to the design data in accordance with the order confirmation, observe the following limits for the through-current and the step voltage:

In the standard version, the on-load tap-changer is designed for sinusoidal 50/60 Hz alternating current with a curve form symmetrical to the zero axis and can switch 2 times the rated through-current $I_{\text{r}}$ at its rated step voltage $U_{\text{r}}$. 
Exceeding the rated step voltage $U_{ir}$ by up to 10% for a short period is permitted as long as the rated step capacity $P_{StN}$ permissible for this step voltage is not exceeded.

### 2.2 Inappropriate use

Use is considered inappropriate if the product is used in a way other than as described in the "Appropriate use" section. In addition, observe the following:

**Prohibited electrical operating conditions**

All operating conditions that do not comply with the design data in accordance with the order confirmation are prohibited.

Prohibited operating conditions may arise due to short circuits as well as due to inrush current impulses when energizing transformers or other electrical machines. This applies to the affected transformer itself just as it does to transformers electrically connected in parallel or serially or other electrical machines.

Higher voltages may occur due to transformer overexcitation following load shedding, for example.

Operations outside of the permitted operating conditions can lead to injury to persons and damage to the product.

- Prevent any such operations outside of the permitted operating conditions by taking suitable measures.

### 2.3 Fundamental safety instructions

To prevent accidents, disruptions and damage as well as unacceptable adverse effects on the environment, those responsible for transport, installation, operation, maintenance and disposal of the product or parts of the product must ensure the following:

**Personal protective equipment**

Loosely worn or unsuitable clothing increases the danger of becoming trapped or caught up in rotating parts and the danger of getting caught on protruding parts. This poses a danger to life and limb.

- Wear appropriate personal protective equipment such as a helmet, work gloves, etc. for the respective activity.
- Never wear damaged personal protective equipment.
- Never wear rings, necklaces, or other jewelry.
- If you have long hair, wear a hairnet.
Work area
Untidy and poorly lit work areas can lead to accidents.
▪ Keep the work area clean and tidy.
▪ Make sure that the work area is well lit.
▪ Observe the applicable laws for accident prevention in the relevant coun-
try.

Working during operation
The product may only be operated in a sound, operational condition. Other-
wise it poses a danger to life and limb.
▪ Regularly check the operational reliability of safety equipment.
▪ Comply with the inspection work, maintenance work and maintenance in-
tervals described in this technical file.

Explosion protection
Highly flammable or explosive gases, vapors and dusts can cause serious
explosions and fire. This increases the danger to life and limb.
▪ Do not install, operate or perform maintenance work on the product in ar-
 eas where a risk of explosion is present.

Safety markings
Warning signs and safety information plates are safety markings on the
product. They are an important aspect of the safety concept.
▪ Observe all safety markings on the product.
▪ Make sure all safety markings on the product remain intact and legible.
▪ Replace safety markings that are damaged or missing.

Ambient conditions
To ensure reliable and safe operation, the product must only be operated
under the ambient conditions specified in the technical data.
▪ Observe the specified operating conditions and requirements for the in-
stallation location.

Auxiliary materials and operating materials
Auxiliary materials and operating materials not approved by the manufac-
turer can lead to personal injury, damage to property and malfunctions of the
product.
▪ Only use insulating fluids [► Section 8.1, Page 54] approved by the manu-
ufacturer.
▪ Only use conductive and grounded hoses, pipes and pump equipment
that are approved for flammable liquids.
• Only use lubricants and auxiliary materials approved by the manufacturer.
• Contact the manufacturer.

**Modifications and conversions**

Unauthorized or inappropriate changes to the product may lead to personal injury, material damage and operational faults.

• Only modify the product after consultation with Maschinenfabrik Reinhausen GmbH.

**Spare parts**

Spare parts not approved by Maschinenfabrik Reinhausen GmbH may lead to physical injury, damage to the product and malfunctions.

• Only use spare parts that have been approved by Maschinenfabrik Reinhausen GmbH.
• Contact Maschinenfabrik Reinhausen GmbH.

### 2.4 Personnel qualification

The person responsible for assembly, commissioning, operation, maintenance and inspection must ensure that the personnel are sufficiently qualified.

**Electrically skilled person**

The electrically skilled person has a technical qualification and therefore has the required knowledge and experience, and is also conversant with the applicable standards and regulations. The electrically skilled person is also proficient in the following:

• Can identify potential dangers independently and is able to avoid them.
• Is able to perform work on electrical systems.
• Is specially trained for the working environment in which (s)he works.
• Must satisfy the requirements of the applicable statutory regulations for accident prevention.

**Electrically trained persons**

An electrically trained person receives instruction and guidance from an electrically skilled person in relation to the tasks undertaken and the potential dangers in the event of inappropriate handling as well as the protective devices and safety measures. The electrically trained person works exclusively under the guidance and supervision of an electrically skilled person.
Operator

The operator uses and operates the product in line with this technical file. The operating company provides the operator with instruction and training on the specific tasks and the associated potential dangers arising from improper handling.

Technical Service

We strongly recommend having maintenance, repairs and retrofitting carried out by our Technical Service department. This ensures that all work is performed correctly. If maintenance is not carried out by our Technical Service department, please ensure that the personnel who carry out the maintenance are trained and authorized by Maschinenfabrik Reinhausen GmbH to carry out the work.

Authorized personnel

Authorized personnel are trained by Maschinenfabrik Reinhausen GmbH to carry out special maintenance.

2.5 Personal protective equipment

Personal protective equipment must be worn during work to minimize risks to health.

- Always wear the personal protective equipment required for the job at hand.
- Never wear damaged personal protective equipment.
- Observe information about personal protective equipment provided in the work area.

Table 3: Personal protective equipment
3 Product description

3.1 On-load tap-changer

3.1.1 Function description

On-load tap-changers are used to adjust the transmission ratio of transformers without interrupting the load flow. This makes it possible to compensate for aspects such as fluctuations in voltage occurring in the power transmission grid. For this purpose, on-load tap-changers are fitted in transformers and connected to the active part of the transformer.

A motor-drive unit which receives a control impulse (e.g. from a voltage regulator) changes the operating position of the on-load tap-changer, as a result of which the transformer's transmission ratio is adapted to the prevailing operating requirements.

Figure 1: System overview of on-load tap-changer, transformer

</tr>
</tbody>
</table>
3.1.2 Setup/versions

The on-load tap-changer consists of the on-load tap-changer head, oil compartment with built-in diverter switch insert and the selector mounted below (also available with change-over selector on request).

The design and designation of the most important on-load tap-changer components are shown in the installation drawings in the appendix.

For the number of maximum operating positions of the on-load tap-changer, refer to the technical data.
To replace a Bulgarian on-load tap-changer of type RS 3, RS 4 or RS 9 with an on-load tap-changer of type OILTAP® MSE, the standard version of the OILTAP® MS on-load tap-changer is equipped with a special on-load tap-changer head.

3.1.2.1 Pipe connections

The on-load tap-changer head features 4 pipe connections for different purposes.
Depending on the order, some or all of these pipe connections are fitted with pipe bends ex factory. All pipe bends without terminal box for the tap-change supervisory control can be freely swiveled once the pressure ring is loosened.

**Pipe connection Q**

The pipe connection Q is closed with a blank cover. Depending on the on-load tap-changer type, either the connection cables of the tap-change supervisory device delivered as an option are routed through the pipe connection, or the oil filter unit is connected to the pipe connection.

The functions of the R and Q pipe connections can be interchanged.

**Pipe connection S**

The pipe bend on pipe connection S features a vent screw and can be connected to a pipe that ends with a drain valve on the side of the transformer tank at operating height. If the on-load tap-changer is fitted with an oil suction pipe, the on-load tap-changer can be completely emptied via pipe connection S.

**Pipe connection R**

Pipe connection R is intended for attachment of the protective relay and connection of the on-load tap-changer oil conservator and can be interchanged with pipe connection Q.

**Pipe connection E2**

Pipe connection E2 is sealed off with a blank cover. It leads into the oil tank of the transformer, directly under the on-load tap-changer head and can be connected to a collective pipe for the Buchholz relay, if necessary. This pipe connection serves a further purpose, namely to equalize the pressure be-
3 Product description

between the transformer tank and oil compartment of the on-load tap-changer, which is necessary for drying, filling with insulating fluid and transportation of the transformer.

3.1.3 Name plate

The nameplate is on the on-load tap-changer head cover.

![Figure 5: Position of nameplate](image)

3.1.4 Protective devices

The on-load tap-changer is equipped with the following protective devices.

3.1.4.1 Protective relay

3.1.4.1.1 Function description

The protective relay is looped into the circuit breaker tripping circuit. It is tripped when the specified speed of flow from the on-load tap-changer head to the oil conservator is exceeded due to a fault. The flowing insulating fluid actuates the flap valve which tips over into position OFF. The contact in the dry-reed magnetic switch is thereby actuated, the circuit breakers are tripped, and the transformer is de-energized.

The protective relay is a component of an on-load tap-changer filled with insulating fluid and its properties conform to the respective applicable version of IEC publication 60214-1.

Diverter switch operations at rated switching capacity or at permissible overload will not cause the protective relay to trip.

The protective relay responds to flow, not to gas accumulated in the protective relay. It is not necessary to bleed the protective relay when filling the transformer with insulating fluid. Gas accumulation in the protective relay is normal.

3.1.4.1.3 Nameplate

The nameplate is on the back of the protective relay.

Figure 9: Nameplate

3.1.4.2 Pressure monitoring device DW

3.1.4.2.1 Function description

The DW 2000 pressure monitoring device protects the on-load tap-changer from impermissible pressure increases, contributing to the safety of the transformer. The pressure monitoring device is installed on the outside of the on-load tap-changer and is tripped by impermissible static and dynamic pressures in the on-load tap-changer oil compartment.

The pressure monitoring device uses a concept where a corrugated tube acts as a barometer together with a spring providing counter force. This assembly is mechanically linked to the sensor on the snap-action switch.

The pressure increase activates the sensor on the snap-action switch, which flips into the OFF position. This triggers the circuit breaker and de-energizes the transformer. The sensor on the snap-action switch has to be reset to the initial position by hand after tripping.

Low-energy interference does not cause the pressure monitoring device to trip since the required tripping pressure is not reached. The tripping pressure is set at the factory and prevented from being changed.

The pressure monitoring device responds to large pressure increases faster than the protective relay. The protective relay is part of the standard MR protection system and comes as standard.

Additional use of a pressure monitoring device also requires installation of the provided protective relay.

The features and characteristics of the pressure monitoring device comply with the respective applicable version of IEC publication 60214-1.
Diverter switch operations at the rated switching capacity or permitted over-load do not cause the pressure-operated relay to trip.

The pressure-operated relay responds to a pressure change and not to gas accumulation under the pressure-operated relay. Gas accumulation under the pressure-operated relay is normal.

3.1.4.2.2 Design/versions

There are two variants of the pressure monitoring device:

- DW 2000 for vertical installation
- DW 2000 for horizontal installation

The housing and the cover cap of the pressure monitoring device consist of lightweight, corrosion-resistant metal.

Figure 10: Snap-action switch and pressure measuring element

</tr>
</tbody>
</table>
3.1.4.3 Rupture disk

The rupture disk is a pressure relief device without signaling contact in accordance with IEC 60214-1 and is located in the on-load tap-changer head cover.

The rupture disk responds to a defined overpressure in the oil compartment of the on-load tap-changer.

3.1.4.4 Pressure relief device MPreC®

On request, MR will supply a pre-fitted MPreC® pressure relief device in place of the rupture disk. This device responds to a defined overpressure in the oil compartment of the on-load tap-changer.

The on-load tap-changer therefore meets the requirements of IEC 60214-1 regarding pressure relief devices.

3.1.4.5 Tap-change supervisory device

The tap-change supervisory device monitors both the drive shaft between on-load tap-changer(s) and motor-drive unit and the correct switching of the diverter switch.
3.1.4.6 Temperature monitoring

The temperature monitoring system monitors the temperature of the insulating fluid in the oil compartment of the on-load tap-changer.
3.2 Drive shaft

3.2.1 Function description

The drive shaft is the mechanical connection between the drive and the on-load tap-changer/de-energized tap-changer.

The bevel gear changes the direction from vertical to horizontal.

Accordingly, the vertical drive shaft has to be mounted between drive and bevel gear, and the horizontal drive shaft between bevel gear and on-load tap-changer or de-energized tap-changer.
3.2.2 Design/versions

The drive shaft consists of a square tube and is coupled at each end by two coupling brackets and one coupling bolt to the driving or driven shaft end of the device to be connected.

3.3 OF 100 Oil Filter Unit

The purpose of the OF 100 oil filter unit is to clean the on-load tap-changer's insulating fluid with the paper filter insert and to clean and dry the fluid with the combined filter insert.

For on-load tap-changers where the number of tap-change operations per year is higher than 15,000, we recommend the use of the OF 100 oil filter unit with paper filter insert. This can extend the intervals between maintenance.

For more information, consult the MR operating instructions "OF 100 oil filter unit".
4 Commissioning

**Danger of explosion!**

Explosive gases in the oil compartment of the on-load tap-changer, transformer, pipework system, oil conservator and at the dehydrating breather opening can deflagrate or explode and result in severe injury or death!

► Ensure that there are no ignition sources such as naked flame, hot surfaces or sparks (e.g. caused by the build-up of static charge) in the transformer's immediate surroundings during commissioning and that none occur.

► Do not operate any electrical devices (e.g. risk of sparks from impact wrench).

► Only use conductive and grounded hoses, pipes, and pump equipment that are approved for flammable liquids.

**WARNING**

Overloading the on-load tap-changer can lead to explosion. Spraying hot insulating fluid and flying parts can lead to death and serious injuries. Property damage is highly probable.

► Ensure that the on-load tap-changer is not overloaded.

► Ensure use of the on-load tap-changer in accordance with section "Appropriate use".

► Prevent operations outside of the permitted operating conditions by taking suitable measures.

4.1 Commissioning transformer at operating site

4.1.1 Filling the oil compartment of the on-load tap-changer with insulating fluid

**NOTICE**

Damage to the on-load tap-changer!

Unsuitable insulating fluids cause damage to the on-load tap-changer.

► Only use insulating fluids [Section 8.1, Page 54] approved by the manufacturer.

1. **NOTICE!** Check whether the on-load tap-changer head cover has a flange for attaching a pressure relief device. If it does, operation without a pressure relief device is not permitted and may result in damage to the on-load tap-changer.

☞ Fit a pressure relief device which is approved for this on-load tap-changer on the on-load tap-changer head.
2. Establish a connecting lead between pipe connection E2 and one of the pipe connections R, S or Q to ensure equal pressure in the oil compartment and transformer during evacuation.

![Figure 17: Connecting lead between E2 and Q](image)

3. Fill on-load tap-changer with new insulating fluid using one of the two free pipe connections of the on-load tap-changer head.

![Figure 18: Pipe connections S and R](image)

4. Take oil sample from oil compartment.
5. Record temperature of oil sample just after sample is taken.
6. Determine dielectric strength and water content at an insulating fluid temperature of 20°C ± 5°C. The dielectric strength and water content must comply with the limit values specified in the technical data.
4.1.2 Bleeding on-load tap-changer head and suction pipe

4.1.2.1 Bleeding on-load tap-changer head

1. Open all forward and return valves in the pipe system.
2. Remove screw cap on air-vent valve E1 on on-load tap-changer head cover.

3. Use screwdriver to lift valve tappet on air-vent valve E1 and bleed on-load tap-changer head.

4. Seal air-vent valve E1 with screw cap (tightening torque 10 Nm).
4.1.2.2 Bleeding suction pipe on pipe connection S

1. Remove screw cap from pipe connection S.

Figure 21: Screw cap

2. **NOTICE!** Open vent screw and bleed suction pipe. Make sure the suction pipe is fully vented. The insulation capability of the on-load tap-changer to ground will otherwise be significantly impaired.

3. Close vent screw.

4. Seal vent screw with screw cap.

4.1.3 Checking motor-drive unit

**NOTICE**

Damage to the on-load tap-changer / de-energized tap-changer!

Damage to the on-load tap-changer / de-energized tap-changer due to actuation of the on-load tap-changer / de-energized tap-changer without insulating fluid.

► Ensure that the selector / de-energized tap changer is fully immersed in insulating fluid and that the oil compartment of the on-load tap-changer is completely filled with insulating fluid.
**NOTICE**

**Damage to the on-load tap-changer and motor-drive unit!**

Damage to on-load tap-changer and motor-drive unit due to incorrect use of position transmitter equipment.

- Only circuits stated in the chapter Technical data for position transmitter equipment may be connected to the position transmitter module connections.
- The switchover point of the position transmitter equipment in the motor-drive unit is not the same as the switchover point of the diverter switch operation. This depends on the type of diverter switch. This fact should be noted when project planning the locking circuits between the motor-drive unit and external equipment (e.g. transformer circuit breaker).
- Therefore, the “Tap changer in operation” position transit contact shown in the connection diagram should be used for external monitoring, locking and control purposes instead of the position transmitter equipment.

Prior to commissioning the transformer, check whether the motor-drive unit and on-load tap-changer are correctly coupled and that the motor-drive unit functions correctly.

**Tests on the motor-drive unit**

1. Perform function checks as described in relevant MR operating instructions for motor-drive unit.
2. **NOTICE!** An incorrectly coupled motor-drive unit will lead to damage to the on-load tap-changer. Undertake trial tap-change operations across the entire range of settings. Ensure that in each operating position, the tap position indicators of motor-drive unit and on-load tap-changer (inspection window in the on-load tap-changer head) match.

**Dielectric tests on transformer wiring**

- Note information relating to dielectric tests on transformer wiring in relevant MR operating instructions for motor-drive unit.

Prior to commissioning the transformer, check whether the motor-drive unit is functioning correctly.

**Tests on the motor-drive unit**

- Perform function checks as described in relevant MR operating instructions for motor-drive unit.

**Dielectric tests on transformer wiring**

- Note information relating to dielectric tests on transformer wiring in relevant MR operating instructions for motor-drive unit.
4.1.4 Checking protective relay

- Check that the protective relay is functioning correctly before commissioning the transformer:
  1. Ground the transformer on the high-voltage side and low-voltage side. Ensure that the grounding for work connection on the transformer is not removed during testing.
  2. Ensure that the transformer remains de-energized during testing.
  3. Deactivate the automatic fire extinguishing device.
  4. Loosen the three screws on the terminal box cover and lift off the terminal box cover.
  5. Remove the slotted head screw for potential tie-in and remove the terminal box cover with wire.
  6. Press OFF test button.
  7. Leave the transformer's danger zone.
  8. Ensure that the transformer's circuit breaker cannot be closed.
  9. Press OPERATION test button.
 10. Leave the transformer's danger zone.
 11. Close the transformer's circuit breaker with isolating switches open and the transformer grounded on all sides.
 12. Press OFF test button.
 13. Ensure that the transformer's circuit breaker is open.
  14. Press OPERATION test button to reset the protective relay.
 15. Position the wire for the terminal box cover and affix using the slotted head screw.
 16. Attach the terminal box cover and secure with screws.

4.1.4.2 Checking protective relay (RS 2004)

- Check that the protective relay is functioning correctly before commissioning the transformer:
  1. Ensure that the flap valve is in the OPERATION position.
  2. Leave the transformer's danger zone.
  3. Close the transformer's circuit breaker with isolating switches open and the transformer grounded on all sides.
  4. Press OFF test button.
  5. Ensure that the transformer's circuit breaker is open.
  6. Active protection test
4.1.5 Checking pressure monitoring device
1. Ground the transformer on the high-voltage side and low-voltage side. Ensure that the grounding for work connection on the transformer is not removed during testing.
2. Ensure that the transformer remains de-energized during testing.
3. Deactivate the automatic fire extinguishing device.
4. Remove the cover cap.
5. Activate the sensor on the snap-action switch.
   ☐ Sensor is in the OFF position.
6. Leave the transformer’s danger zone.
7. Ensure that the transformer’s circuit breaker cannot be closed.
   ☐ Passive protection test
8. Activate the sensor on the snap-action switch.
   ☐ Sensor is in the OPERATION position.
9. Leave the transformer’s danger zone.
10. Close the transformer’s circuit breaker with isolating switches open and the transformer grounded on all sides.
11. Activate the sensor on the snap-action switch.
    ☐ Sensor is in the OFF position.
12. Ensure that the transformer’s circuit breaker is open.
    ☐ Active protection test.
13. Activate the sensor on the snap-action switch to reset the pressure monitoring device.
    ☐ Sensor is in the OPERATION position.
14. Secure the cover cap.

4.1.6 Commissioning the transformer
- The signaling contact for falling below the minimum insulating fluid fill level in the on-load tap-changer’s oil conservator is looped into the tripping circuit of the circuit breaker.
- The protective relay and additional protective devices are looped into the circuit breaker’s tripping circuit.
- The motor-drive unit and all protective devices are functioning correctly and are ready for use.
- The oil compartment of the on-load tap-changer is completely filled with insulation fluid.
- All stop-cocks between on-load tap-changer and oil conservator of the on-load tap-changer are open.
1. Switch on transformer.
2. **NOTICE!** Inrush current impulses can be significantly greater than the transformer rated current and may lead to current paths with asymmetrical or non-sinusoidal curve shapes and, as a result, overload the on-load tap-
changer during the diverter switch operation. Only perform tap-change operations - whether under no load or under load conditions - once the in-rush current impulse has subsided.
5 Operation

5.1 Operating the motor-drive unit with the hand crank

**WARNING**

**Danger of explosion!**

Unauthorized operation of the motor-drive unit with the hand crank may result in death or serious injury.

► Never operate the motor-drive unit electrically or with the hand crank before the transformer has been disconnected if you think there may be a fault in the transformer or on-load tap-changer / de-energized tap-changer.

► Never use the hand crank to complete a tap-change operation that has begun electrically, but has not been ended completely.

► If the hand crank is difficult to move, you must stop using it.

► When operating the motor-drive unit with the hand crank, never reverse the direction of rotation.

► If there is any doubt about the on-load tap-changer / de-energized tap-changer being in proper working condition or about the cause of a fault in the motor-drive unit, contact the Technical Service department of Maschinenfabrik Reinhausen GmbH immediately.

► To operate the motor-drive unit manually, only use the hand crank mounted in the motor-drive unit.

For information about fault rectification, refer to the "Fault elimination" chapter.

**Normal operation**

During normal operation, there is no need to operate the unit with the hand crank. The hand crank is mainly required during installation and for tests in the transformer plant.

Use of the hand crank for operating the motor-drive unit is permitted if the transformer is disconnected, e.g. for maintenance tasks, if there is no detectable fault on the transformer or on-load tap-changer / de-energized tap-changer and the previous tap-change operation has been completed correctly.

**Emergency operation exception**

An operation is considered an emergency operation if a tap-change operation is absolutely necessary when a transformer is energized, despite a fault in the motor-drive unit. In this case, be sure to observe the warnings listed above.
Operating the motor-drive unit with the hand crank

To carry out a tap-change operation with the hand crank, proceed as follows:

1. Open the door of the protective housing for the motor-drive unit.
2. Switch off motor protective switch Q1 (position 0).
3. Insert the hand crank mounted in the motor-drive unit into the hand crank aperture in the upper cover plate.
   ➤ The built-in hand crank interlock switch interrupts the motor circuit at two poles. The control circuit will not be interrupted.
4. **NOTICE!** Damage to the on-load tap-changer due to tap-change operation not being completed correctly. Turn the hand crank in one direction until the pointer has fully circled the tap-change indicator once and is again in the mid-position of the area marked in gray on the tap-change indicator.
   ➤ The tap-change operation is complete.
5. Remove the hand crank and return it to the mounting bracket.
6. Switch on motor protective switch Q1 (position I).
7. Close the door of the protective housing for the motor-drive unit.
6 Fault elimination

**WARNING**

Danger of explosion!

Explosive gases under the on-load tap-changer head cover can deflagrate or explode and result in severe injury or death.

- Ensure that there are no ignition sources such as open flames, hot surfaces or sparks (e.g. caused by the build-up of static charge) in the immediate surroundings and that none occur.
- De-energize all auxiliary circuits (for example tap-change supervisory device, pressure relief device, pressure monitoring device) before removing the on-load tap-changer head cover.
- Do not operate any electrical devices during the work (e.g. risk of sparks from impact wrench).

**NOTICE**

Damage to the on-load tap-changer and transformer!

If the protective relay or other protective devices trip, this can indicate damage to the on-load tap-changer and transformer. The transformer must not be energized without being inspected first.

- Check on-load tap-changer and transformer when protective relay or other protective devices have been tripped.
- Do not use the equipment again until you are sure there is no damage to the on-load tap-changer or transformer.

**NOTICE**

Damage to motor-drive unit!

Damage to the motor-drive unit due to condensate in protective housing of motor-drive unit.

- Always keep protective housing of the motor-drive unit tightly closed.
- In the event of operation interruptions of more than 2 weeks, connect and operate the anti-condensation heater in the motor-drive unit. If this is not possible, e.g. during transportation, place a sufficient amount of desiccant in the protective housing.

The table below is intended to assist with detecting and, where possible, remedying faults.

For more information, please consult the operating instructions for the protective relay or the relevant protective device.

In the event of faults on the on-load tap-changer and motor-drive unit which cannot be easily corrected on site, or if the protective relay or additional protective devices have been tripped, please inform your authorized MR representative, the transformer manufacturer or contact MR directly.

### 6.1 Tripping the protective relay and re-commissioning the transformer

**WARNING**

**Danger of explosion!**
Explosive gases in the protective relay can deflagrate or explode and result in severe injury or death.

► Wait 15 minutes after switching off the transformer before beginning further work on the protective relay so that the gases can dissipate.

► Ensure that there are no ignition sources such as naked flames, hot surfaces or sparks (e.g. caused by the build-up of static charge) in the immediate surroundings and that none occur.

► De-energize all auxiliary circuits before beginning work.

► Do not operate any electrical devices during the work (e.g. risk of sparks from impact wrench).

**WARNING**

**Danger of death or severe injury!**
Danger of severe injury or death if on-load tap-changer and transformer are insufficiently tested.

► Be sure to contact Maschinenfabrik Reinhausen to check on-load tap-changer and transformer if the protective relay has tripped.

► Only use the equipment again when you are sure there is no damage to the on-load tap-changer or transformer.

When the circuit breakers have been tripped by the protective relay, proceed as follows:

1. Establish time of tripping.
2. Determine operating position of on-load tap-changer.
3. As a precaution, block the motor-drive unit by tripping the motor protective switch to prevent the on-load tap-changer from being actuated by remote control.
4. Check the on-load tap-changer head cover. If insulating fluid is leaking, close the oil conservator stop valve immediately.
5. Check whether the flap valve of the protective relay is in the OFF or OPERATION position.

6.1.1 Flap valve in OPERATION position
If the flap valve is in the OPERATION position, there may be a fault in the tripping circuit. Check the tripping circuit in this case. If you are not able to clarify why the protective relay tripped, be sure to contact Maschinenfabrik Reinhausen to check the on-load tap-changer.

6.1.2 Flap valve in OFF position
Note that protective relay RS 2004 features an automatic reset mechanism which means that the flap valve does not remain in the OFF position after tripping. If the protective relay RS 2004 has not tripped due to an error in the tripping circuit, also proceed as described below for RS 2004.

If the flap valve is in the OFF position, proceed as follows:
1. Ensure that the transformer is not started up under any circumstances.
2. Contact and inform Maschinenfabrik Reinhausen of the following:
   - Serial number of protective relay and on-load tap-changer
   - What was the load of the transformer at the instant of tripping?
   - Was the on-load tap-changer moved immediately before or during tripping?
   - Did any other protective devices of the transformer respond at the instant of tripping?
   - Were switching operations in the network being carried out at the instant of tripping?
   - Were overvoltages registered at the instant of tripping?
3. Take further action in agreement with Maschinenfabrik Reinhausen.

6.1.3 Re-commissioning the transformer
Once the reason for the protective relay tripping has been established and remedied, you can re-commission the transformer:
1. Check the protective relay [Section 4.1.4.1, Page 38].
2. Commission the transformer.
6.2 Tripping the pressure monitoring device and putting the transformer back into operation

**WARNING**

Danger of death or severe injury!

Danger of severe injury or death if on-load tap-changer and transformer are insufficiently tested.

- Be sure to contact Maschinenfabrik Reinhausen to check on-load tap-changer and transformer after the pressure monitoring device has been tripped.
- Only use the equipment again when you are sure there is no damage to the on-load tap-changer or transformer.

If the circuit breaker is tripped by the pressure monitoring device, proceed as follows:

1. Establish time of tripping.
2. Determine operating position of on-load tap-changer.
3. As a precaution, block the motor-drive unit by tripping the motor protective switch to prevent the on-load tap-changer from being actuated by remote control.
4. Check the on-load tap-changer head cover. If insulating fluid is leaking, close the oil conservator stop valve immediately.
5. Check whether the pressure monitoring device sensor is in the OFF position or OPERATION position.

**6.2.1 Sensor in the OPERATION position**

If the sensor is in the OPERATION position, there may be an error in the tripping circuit. Check the tripping circuit in this case. If you are not able to clarify why the pressure monitoring device tripped, be sure to contact Maschinenfabrik Reinhausen to check the on-load tap-changer.
6.2.2 Sensor in the OFF position

Proceed as follows if the sensor is in the OFF position.

1. Ensure that the transformer is not started up under any circumstances.

2. Contact and inform Maschinenfabrik Reinhausen of the following:
   - What was the load of the transformer at the instant of tripping?
   - Was there a tap-change operation on the on-load tap-changer immediately before or during the tripping?
   - Did any other protective devices of the transformer respond at the instant of tripping?
   - Were switching operations in the network being carried out at the instant of tripping?
   - Were overvoltages registered at the instant of tripping?
   - How high is the static pressure on the pressure relief device (height difference between the oil level in the on-load tap-changer oil conservator and the pressure relief device)?

3. Take further action in agreement with Maschinenfabrik Reinhausen.

6.2.3 Re-commissioning the transformer

You can re-commission the transformer once the cause for tripping the pressure monitoring device has been determined and resolved:

1. Ensure that the sensor on the snap-action switch is in the OPERATION position.

2. Commission the transformer.
7 Maintenance

**DANGER**

Electric shock!

An energized transformer could cause death or serious injuries.

► Switch off transformer on high and low-voltage side.
► Lock transformer to prevent unintentional restart.
► Ensure that everything is de-energized.
► Visibly connect all transformer terminals to ground (grounding leads, grounding disconnectors) and short circuit them.
► Cover or cordon off adjacent energized parts.

**DANGER**

Electric shock!

Working on the on-load tap-changer when on-load tap-changer components are energized can lead to death or serious injuries.

► De-energize all auxiliary circuits, such as the tap-change supervisory device, pressure relief device, pressure monitoring device.
► Make sure that everything is de-energized.

**WARNING**

Danger of explosion!

Explosive gases in the oil compartment of the on-load tap-changer, transformer, pipe system, oil conservator and at the dehydrating breather opening can deflagrate or explode and result in severe injury or death.

► Ensure that there are no ignition sources such as naked flames, hot surfaces or sparks (e.g. caused by the build-up of static charge) in the transformer's immediate surroundings and that none occur.
► Do not operate any electrical devices (e.g. risk of sparks from impact wrench).
► Only use conductive and grounded hoses, pipes, and pump equipment that are approved for flammable liquids.

**NOTICE**

Damage to motor-drive unit!

Damage to the motor-drive unit due to condensate in protective housing of motor-drive unit.

► Always keep protective housing of the motor-drive unit tightly closed.
► In the event of operation interruptions of more than 2 weeks, connect and operate the anti-condensation heater in the motor-drive unit. If this is not possible, e.g. during transportation, place a sufficient amount of desiccant in the protective housing.
### 7.1 Inspection

Monitoring the on-load tap-changer and motor-drive unit/control cabinet is limited to occasional visual checks and monitoring the quality of the insulating fluid. For efficiency reasons these visual inspections can be combined with the usual checks on the transformer.

Table 5: Inspection plan
7.2 Maintenance intervals

**NOTICE**

**Damage to on-load tap-changer and transformer!**

Improper maintenance or exceeding the maintenance intervals can lead to damage to the on-load tap-changer and transformer.

► Observe maintenance intervals.
► Ensure complete and proper maintenance.

A label on the inside of the door of the ED motor-drive unit clearly specifies the relevant maintenance interval.

When using the TAPGUARD® 260 device, the maintenance intervals stated on the TAPGUARD® 260 device display apply. More information can be found in the operating instructions for the TAPGUARD® 260.

![Figure 22: Label showing maintenance intervals](image)

The maintenance intervals of the selector, diverter switch insert and the complete on-load tap-changer are described below.

**Maintenance interval of selector**

The selector of the on-load tap-changer is generally maintenance-free. In special cases, for example industrial transformers with a large number of tap-change operations, maintenance should be undertaken on the selector after 1,000,000 tap changes.
Diverter switch insert replacement interval

The diverter switch insert must be replaced after 800,000 tap change operations.

Maintenance intervals for OILTAP® MSE on-load tap-changer

1. Maintenance

After 7 years, or after the number of tap-change operations stated in the following table, whichever is reached first.

Further maintenance

After 7 years, or after the number of tap-change operations stated in the following table, whichever is reached first.

Table 6: Maintenance intervals

7.3 Oil change

Damage to the on-load tap-changer!

Unsuitable insulating fluids cause damage to the on-load tap-changer.

► Only use insulating fluids [Section 8.1, Page 54] approved by the manufacturer.

► Ensure that the new insulating fluid has the same chemical, mechanical, thermal and electrical properties. Otherwise, contact Maschinenfabrik Reinhausen GmbH's Technical Service department.

The dielectric strength and water content of the insulating fluid must be determined after filling. Proceed as follows:

1. Take an insulating fluid sample from the oil compartment.

2. Record the temperature of the sample immediately after the sample is taken.

3. Determine dielectric strength and water content at a diverter switch oil temperature of 20 °C ± 5 °C. The dielectric strength and water content must comply with the limit values [Section 8.6, Page 61] specified in the technical data.

7.4 Performing DC resistance measurement on transformer

The measured DC current is normally restricted to 10% of the rated current of the measured transformer winding in order to prevent the winding from overheating.
Perform the DC resistance measurement in various on-load tap-changer operating positions. You need to distinguish here whether the measured current is interrupted when changing operating position or not.

<table>

Insulating fluid

- Unused insulating oils derived from petroleum products in accordance with IEC60296 and ASTM D3487 (equivalent standards on request)
- Unused insulating oils derived from other virgin hydrocarbons in accordance with IEC60296, or blends of these oils with petroleum products in accordance with IEC60296, ASTM D3487 or equivalent standards on request
- Alternative insulating fluids, such as natural and synthetic esters or silicone oils, on request.

1) Gas-to-liquid oils (GTL oils) are understood in this context as petroleum products
