

The digital consulting approach for fleet management for power transformers.

Power transformers are valuable and strategically important assets in a substation. Operators face the challenge of optimizing the overall financial performance by maintaining high reliability and extending life at minimal cost.

Your advantages at a glance

- The condition of the transformer fleet at a glance - identify critical units in good time
- Clear and prioritized recommendations for action for optimal budget and resource allocation
- Consideration of data uncertainty as a reliable basis for decision-making
- Customized and cost-efficient data acquisition
- Web application as central information management system for independent data

Failure risk index
